Bernd Kröplin was a full professor at the Faculty of Aeronautics and Astronautics at the University of Stuttgart. In 1999, he received the "Körber Prize for European Science," which came with an endowment of 1.5 million marks. After that, Prof. Kröplin led a research team that was to develop space medicine for astronauts aboard spacecraft, which would enable them to provide self-care on a bioenergetic treatment basis for minor health complaints.

Bernd Kröplin was a full professor at the Faculty of Aeronautics and Astronautics at the University of Stuttgart. In 1999, he received the "Körber Prize for European Science," which came with an endowment of 1.5 million marks. After that, Prof. Kröplin led a research team that was to develop space medicine for astronauts aboard spacecraft, which would enable them to provide self-care on a bioenergetic treatment basis for minor health complaints. During their investigations, the researchers had discovered that weak field effects, which cannot be detected using conventional measurement methods, manifest themselves in water and can be photographed under the dark-field microscope. In thousands of repeated experiments, the researchers were able to document fundamental findings, which each individually, completely overturn two fundamental worldviews of "approved" science and the "accepted" notion of the spiritual power of humanity:

Thoughts change matter Water has a kind of memory
