Dr. Pollack, Professor of Bioengineering in Seattle, has demonstrated through his life's work countless times a revolutionary chemical property of water. His findings have the potential to completely turn upside down fields such as clean energy generation, health and much more. More than 50 years ago, approximately a dozen academics came upon similar research, but against the yoke that the world is firmly held by through existing business models in the areas of oil, medicine, etc., no single scientist has yet been able to prevail. Since it is not to be expected that so-called mainstream media will report on a scientific prize for one of these visionaries, you will learn about the groundbreaking findings of a 4th state of aggregation of water in this channel.

This 4th state of aggregation is called "exclusion zone" water or in English "Exclusion Zone" water or simply "EZ" water, which sounds like "easy water" when spoken in English. This EZ water can be imagined like a kind of gel and actually even has a different chemical composition than H2O. H2O, as we know it from normal water, changes into a hexagonal, six-sided structure and has the chemical composition H3O2 in this zone.

On the formation of this zone: When a hydrophilic substance is added to water, that is, a substance that interacts strongly with water or is water-soluble, it has been observed that water molecules distance themselves from this material. When normal water is cooled down, an area forms between this material and the regular water that cleans itself and excludes everything other than hydrogen and oxygen. Even salts and bacteria are pushed out of this area. Hence the term "exclusion zone," or Exclusion Zone (EZ). This zone becomes negatively charged, changes its electronic resistance and pH value, absorbs infrared light and is energized in this way.

This hydrophilic material, which is material that attracts water, is important because in the structures of our body there is no normal drinking water, but rather EZ water. This is because every cell is surrounded by hydrophilic material. This means that every water we consume must first be converted into EZ water. Only through this state of aggregation can our macromolecules and cell membranes function properly. And what is particularly important:

this EZ water is charged by sunlight. Exactly here lies the reason why humans feel energized after spending time in sunlight.

So when you consume the cleanest, purest and ideally cell-available water, preferably already hexagonally structured, you support your body functions enormously and take a lot of work off your body. We will report more often in this channel about the groundbreaking findings of Dr. Pollack. So, send your kids out to play in the light every day, ideally be there yourselves and provide yourselves with high-quality water. More information will be available at this address soon: https://t.me/truuinfochannel

It's good.
to be truu.
