However, large segments of the US population describe fluoridation as water pollution and claim that fluoridation is merely due to a clever move by the fertilizer industry, which was seeking a cost-effective solution for the "dumping" of its hazardous waste generated in fertilizer production. This thesis is supported by more than 2000 studies that have by now demonstrated the health hazards of fluoride in drinking water. Some find it extremely suspicious that the fluoride added to water is actually an untreated, industrial waste product from the fertilizer industry and not a product of pharmaceutical purity. Critics of fluoridation also refuse to believe that a chemical that is deposited as hazardous waste on the premises of a fertilizer company and must be disposed of at great cost to comply with hazardous waste regulations suddenly becomes a savior of dental health in small children once it is added to drinking water. Furthermore, the fluorosilicic acid used for fluoridation is frequently contaminated with lead, arsenic, uranium, radium, aluminum and other industrial pollutants.

Dr. Paul Connett, emeritus professor of environmental chemistry and toxicology at St. Lawrence University, has been advocating against the fluoridation of drinking water for years. Regarding the results of the 2019 study, he says: "No matter how you look at it, you have to be extremely fixated on fluoridation not to take this incredibly seriously. Remember, there is absolutely no evidence - no scientific evidence - that a fetus exposed to fluoride has less tooth decay. There is no evidence that you are protecting the baby during pregnancy from future cavities. Any evidence suggesting that the brain could be damaged must therefore be taken seriously."

The only reliable protection against contaminants such as fluoride, lead, arsenic, uranium, radium, aluminum and many other harmful substances is a private water filtration system. Water refinement systems from truu GmbH produce not only safe water because it is absolutely clean and pure, it is also cell-available and ideal so that it can fulfill its function as a solvent and transport medium in the body.
