Dr. med. Alois Riedler (Austria)

Pure, clean water against common diseases such as high blood pressure, heart attack and stroke, rheumatism, cancer, or osteoporosis. Dr. Riedler from his essay: "The Water Being Human": "In the cell, metabolism-the actual building up and maintenance of our body-takes place. Here the substances that enter are transformed, rebuilt and recombined. Here they change their composition and functions, hence the term 'metabolism'. All areas of our body depend directly on the work of cells. Between the cells, the lymph tissue and blood vessels, however, there exists yet another important water-bearing area that has been greatly neglected in research so far: the space between the cells. ...

Pure, clean water against common diseases such as high blood pressure, heart attack and stroke, rheumatism, cancer, or osteoporosis.

Dr. Riedler from his essay: "The Water Being Human": "In the cell, metabolism-the actual building up and maintenance of our body-takes place. Here the substances that enter are transformed, rebuilt and recombined. Here they change their composition and functions, hence the term 'metabolism'. All areas of our body depend directly on the work of cells. Between the cells, the lymph tissue and blood vessels, however, there exists yet another important water-bearing area that has been greatly neglected in research so far: the space between the cells. This intercellular space contains loose structures that we call 'connective tissue'. In the connective tissue, nerve fibers and connective tissue fibers are found in a fine mesh network that makes up the actual fine structure of the connective tissue. Everything that cannot be excreted through the usual organs is deposited in the body, specifically in the loose connective tissue. Here deposits accumulate. Here is the body's waste dump. If we store only one gram daily in our organism that we cannot excrete, then that is 365 grams per year, 3.65 kilos in 10 years, and 22 kilos in 50 or 60 years. However, the consequence of this accumulation of toxins is not only weight gain; at the same time, acidification and fatty degeneration of the connective tissue occurs. Through the accumulation of toxins and fatty degeneration, the passage from the blood vessel to the cell naturally becomes increasingly difficult. Where previously relatively free access was possible, there is now solid matter that increasingly blocks the flow as we age. The organism attempts to compensate by increasing pressure in the vascular system. In civilized countries, it is therefore taken for granted that blood pressure rises with advancing age. However, the fact that high blood pressure is merely an expression of the increasingly impaired permeability of this interstitial tissue has not yet penetrated the consciousness of orthodox medicine. All common diseases such as heart

attack and stroke, rheumatism, cancer, or osteoporosis are inextricably linked to these conditions of toxin accumulation, over-acidification, and reduced oxygen supply. Here the connection to water closes, because through high-quality water that is capable of being a solvent, we can ensure the cleansing of our connective tissue. It is no accident that during the most intensive cleansing process we know-fasting-it is particularly important to supply high-quality water with the best solvent properties. That is, water that is not limited in its absorption capacity by substances it contains."

Anyone who has not yet experienced the effect of such high-quality water on their body, with the quality to penetrate the connective tissue, should try this for one week in their lifetime! Throughout Germany and Switzerland there are so-called "water filling stations" where this is usually possible free of charge. Click on this link to find out how you can personally experience the effect of purest, cleanest, cell-available water on your body and your mind!
