A study by Dr. A. Weber titled "Living Water as a Free Radical Scavenger" provided important insights into the health benefits of living water:

The investigation showed that living water acts as a reliable free radical scavenger . Dr. Weber found that living water could reduce free radicals in a short time just as effectively as vitamin C and selenium infusions . When treating tumor patients, Dr. Weber observed that after drinking water with high cellular availability, treatment results improved . This empirical observation led to further scientific studies to prove the effectiveness of living water .

"All exchange of substances and information between cells takes place through our body water. When there is a fluid deficiency in the body, communication suffers and thus the entire metabolism both inside and outside the cell. Because our cells are made up of 99% water. Metabolism takes place via water as the transport medium. Through water, the cell is supplied with oxygen and nutrients." (Journal: "Natural Medicine")
