The film "Plastic Planet" is a cinema documentary that causes most people to develop a completely changed awareness of how they handle plastic. Director Werner Boote used over 700 studies for his film. His grandfather was managing director of the German Interplastik-Werke in the 1960s. Boote bridges the gap from that era to the present day and illustrates very clearly the dangers of plastic and synthetic materials in general in their many different forms and their worldwide distribution. Werner Boote traveled around the world for the film, observing and interviewing people about their lives with plastic: from families in their single-family homes in Austria and the USA to those living in the most basic huts in Calcutta. He conducts interviews with representatives of the plastics industry and with scientists who speak about the health hazards of additives - particularly plasticizers. The film shows how plastic waste is distributed to the most remote regions of the earth and affects both the desert in Morocco and the Pacific. The film demonstrates how omnipresent plastic has become in its many forms and how plastic waste is distributed to the most remote regions of the earth. It illustrates this exemplarily through the pollution of the desert in Morocco and plastic waste in the Pacific, where particles of decomposing plastic waste are mistaken for plankton by marine life and consumed, which can lead to their death. We recommend this film on this https://t.me/truuinfochannel, because it creates important awareness about how we burden and damage the environment, animals and ultimately ourselves through the careless use of plastic. Below this message you will find the trailer for "Plastic Planet". The film is offered by various internet portals and lasts over an hour.

Anyone who produces their own water at home with the help of a professional water refinement system simultaneously helps relieve the world of plastic bottles and prevents microplastic intake from contaminated mineral water by 100%. Since hardly anyone can any longer prevent microplastic intake through food, it is particularly important for maintaining health to spare the body from additional contamination through tap water and mineral water.

You will find further uncensored information about the health benefits of pure, clean, mineral-poor water at https://t.me/truuinfochannel

It's good.
to be truu.
