As of January 2022, there are at least 74 studies showing that fluoride damages children's brains and lowers IQ. There are at least 60 studies showing that fluoride impairs the learning and/or memory capacity of animals. Furthermore, there are more than 2,000 additional studies describing other health effects. A team of American and Canadian scientists has now (2022) launched a new investigation into nerve tissue damage caused by fluoride in early childhood. You can find more information about fluoride in drinking water and how to protect

yourself from it here:

It's good.
