Prof. Chris Exley, also called "Mr. Aluminium". Among other things, he discovered that the light metal occurs increasingly frequently in water. In August 2021, he and two of his colleagues had to leave Keele University Staffordshire, England, after 37 years of aluminium research. Exley had detected more aluminium in the brains of autistic children than in elderly people suffering from dementia. Apparently, the many early vaccinations of babies cause this alarming contamination. Aluminium is known to be added to vaccines as an immune booster (adjuvants) and crosses the blood-brain barrier. Following this finding, Prof. Exley and his team were fired. In his farewell letter, he writes: "It is difficult to find academic institutions that have not been corrupted by Bill Gates, GAVI, etc." He and his colleagues now conduct research privately and have created an independent website: https://www.aluminiumresearchgroup.com/

The good news: Aluminium can be eliminated again! More on this, here

It's good.
to be truu.
