Why do ZDF and other major media outlets no longer report on the regular distribution of aluminum-containing substances over Germany?

According to ZDF from 2009, tons of chemical substances are being dispersed over Germany during military exercises. The certified weather biologist Gunther Tiersch (see video 00:42 and 13:12) casually interpreted "unnatural cloud formations on the weather map" in the ZDF heute-journal from January 14, 2009 - and at that time still completely at ease - as artificial dispersal by military aircraft. Some attentive viewers were alerted by this casual report during prime time and asked meteorologists about it. It turned out that meteorologists have known for years that military aircraft regularly disperse tons of chemical substances over Germany, which then produce "strange ghost clouds."

After the phenomenon kept appearing, the scientist and his colleagues went public. In 2005, ZDF still had Karsten Brandt, meteorologist at the German Aerospace Center Karlsruhe, speak out (min. 13:44). Subsequently, an entire group of scientists from the DLR Research Center Karlsruhe, and the universities of Bonn and Hamburg addressed the topic. They found that military aircraft regularly distribute substances over hundreds of kilometers.

Brandt put it succinctly: "We establish environmental zones but apparently environmental zones don't apply at 4-5 kilometers altitude over the North Sea and Germany, where it doesn't matter what is being dispersed. I find that incredible."

Discussions on this topic have not appeared in public media for years. That no one feels responsible for substances that are regularly deposited over Germany is simply considered absurd by meteorologists.

Thorsten Ressler from the Technical University of Berlin says in the video about the chemical substances dispersed in the air: "The analysis of the material showed that the main components are aluminum and silicon, along with calcium, magnesium and boron."

Moderator Kristina zur Mühlen, (formerly from the science magazine "nano", ZDF; today news anchor) explains in the same video that during the annual NATO exercise for electronic warfare ("code name": "ELITE") alone over Baden-Württemberg more than 2.5 tons of chemical substances are scattered. Even ZDF was unable to find out the amount of chemicals distributed nationwide.

We are presenting this article in this channel, which is about the value of pure, clean water, to show why the use of a high-quality water filter is necessary today if you want to protect yourself from the absorption of highly toxic aluminum through tap water. Because everything that falls from the sky ends up in our water bodies and is pumped completely unfiltered through the pipe systems into all kitchens and bathrooms.

Mainstream media seem to thrive on spreading threat scenarios and daily warning and disaster reports. Why there is a veil of silence precisely over this explosive topic may only coincidentally have to do with the findings of one of the world's most knowledgeable and most cited aluminum researchers, Prof. Christopher Exley. Exley has published over 200 peer-reviewed scientific papers and wrote the book on aluminum: "Imagine You Are an Aluminium Atom: Discussions With Mr. Aluminum" (Skyhorse, 2020). Exley says: "If you don't have aluminum in your brain, you won't develop Alzheimer's disease over the course of your life."

It's good.
to be truu.
